

**The first page of the questionnaire** (the same is covered by the respective software)

Assessment of chemical risks at workplaces: Exposure via inhalation and via the dermal route.

General guidance

Each task should be assessed separately in order to find the most dangerous or exposing work phases. Possible high risk but short-term tasks include loading, feeding, maintenance, etc. Manual tasks in general should be specifically focused on. The overall process itself may be mainly closed, or efficiently segregated, and, therefore, safe for the workers.

Before answering, check (in the SDS) the recommended glow material and the specifications of the breathing mask.

If you are uncertain of the answer, read the instructions carefully.
